

Primary Light Clips

Provided by Wet Rocks Diving www.WetRocksDiving.com

Bungee loop at back end of light/ballast for temp clip. Bungee loop is tied either with Fisherman's knot or just Overhead stopper knots at either end of bungee and in both cases, attached using "the knot"

Main clip as small as possible based on your thickest gloves. No bigger than 3/4" eye ever. Put on goodman handle where your left thumb would rest.

Below please see some other examples of how these clips and loops look on other types of lights:
Below is a corded LED light with adjustable handle. Loop is tied on with "the knot" at the rear of the light (where the ballast would have been in the older HID type lights) and the clip tied on the "left-thumb-size".

Below is a cordless light, here the light as a special tie off point allowing the bungee loop to be attached without having to secure it with "the knot."
